Introduction

The aims of this thesis are to look at contemporary newspaper
design and layout, and to discuss its interaction with the new
graphic technology.

In recent years the term "new technology" has come to encompass a
broad range of technological advances which have made a great
impact in many industries. The basic unit of this new
technology is the computer. The main function of the computer is
to process information, and so the phenomenon of the new
technology is defined as - information processing technology.

Tom Forester states in his book, <u>Computers in the Human
Context</u>, that:

> It is generally agreed that the computer is probably the most
> important technological innovation this century, and that
> information technology is a pervasive technology at least as
> important as electricity or steam power. **(FORESTER, 1989
> Pg.1)**

It is helpful however, to define the term "new technology" within
the context of this essay. By it we mean the process of
computerisation, and the use of computers, ranging from direct
input and the use of word processing by journalists, to on-screen
layout methods by designers and sub-editors, using newly designed
computer equipment and software.

Chapter 1

*A brief history
of developments
in print technology
relating to
newspaper design.*

3
It would be a mistake to assume that the recent changes in print
and design technology are the first events of this kind.   There
have been several major changes in the history of printed
communication.   As Jan V. White states in his book Graphic
Design for the Electronic Age, it is 'One more event in the long
and proud history of human communication ... Just the newest link
in a very long chain.'(WHITE, 1988 Pg IX)

While this point of view may distort an objective discussion of
the new technology (because it implies a sense of inevitability
about its development) it does give us an opportunity to look at
some of the technological changes that have effected systems of
print design.

4

Within the specific area of printed communication, there is a
haziness about its actual beginning.   For instance, the Chinese
developed moveable type in 1221, and the Korean Emperor Tsai-Tung
ordered the manufacture of bronze printing-type in 1390.   It is
generally agreed, however, that the history of printed type in
the Western world begins in 1450, with the invention of the
printing press and moveable type by Johann Gutenberg, in Mainz,
Germany.

The early history and spread of moveable type is well documented, and to discuss it here would be beyond the scope of this thesis. It is true to state, however, as Elizabeth Eisenstein does in her book The Printing Press as an Agent of Change, that by the late fifteenth century: 'The reproduction of written materials began to move from the copyist's desk to the printer's workshops.' (EISENSTEIN,1979, Pg.3)

The typeface that Gutenberg designed, however, does not look much like those that we are familiar with today. With its three hundred letters, ligatures and abbreviations, it is more closely related to the block-letter script of manuscripts. (Fig.1)

Our own contemporary typefaces have their beginnings in the faces created by Nicholas Jenson in 1470, in Venice. Jenson took as his inspiration the classic (as he saw it), proportions of Roman lettering.

As we have seen, the spread of printing throughout Europe was rapid. By 1476 when William Caxton set up his press in Westminster, there were printing presses in most centres of culture in Germany, France and Italy.

The rise of the periodical press and with it newspapers, began in the early sixteenth century, with the appearance of regular newsletters, which were used to circulate information between large trading companies. These news letters quickly evolved into public newspapers. As S.H. Steinberg explains in his book Five Hundred Years of Printing,

> From the middle of the century onwards speculative printers took the decisive step of transforming these private news-letters into public news-books, which soon developed into news-sheets and eventually newspapers. [STEINBERG, 1979, Pg.242]

There is evidence here of how technology and the system of production may effect the form of the newspaper, namely the switch from the handwritten newsletter to the early printed newsbook, and later (when printers found it more economic not to bind these periodical newsbooks), the news-sheet and the beginnings of the modern newspaper.

The first regularly published weekly periodical appeared in Strasbourg in 1609, and by the late seventeenth century the newspaper had become an established form of communication throughout Europe and also the New World.

> By the early years of the eighteenth century the periodical press, newspapers as well as magazines, had become an established institution, and from decade to decade gained new strength. (STEINBERG, 1979 Pg.250)

While the demand for and consumption of newspapers grew during this period, the basic technology changed very little. It was not until the invention of the rotary press (and later the steam-driven rotary press), that production met demand. Type, however, was still set by hand, in basically the same manner as it had been since the development of the printing press.

The next major change in newspaper technology (and indeed all print technology) made the process of hand-setting obsolete in terms of mass production.

The Linotype composing machine, invented by Ottomar Merganthaler (1854-99), a German living in America, worked on the principle of assembling matrices or moulds of type which were automatically justified, and from which lines of type, known as slugs, could be cast.

Merganthaler completed his first machine in 1885, and in 1890 a much improved version was available. Tolber Lanston (1844-1913) was at the same time working on a different principle which led in 1889 to the invention of the Monotype composing machine. Unlike the Linotype, the Monotype had only one matrix for each character. The operator worked at a keyboard which in turn perforated a paper ribbon, which in turn operated the casting function of the machine, which produced lines of single type, justified and ready for proofing.

The advantages of these new, speedy and efficient means of
casting type were immediately obvious to the newspaper industry;
or to be more specific, the owners and management of large
newspaper organisations.   The abilities of these two machines
meant that a newspaper did not have to retain highly skilled
(and well paid) hand setters and compositors.   The economic
advantages appealed to owners and management.   The print Unions,
however, were not so enthusiastic.   For instance, when a Blower
Linotype linecaster machine was installed in the New York Tribune
in 1886, it was in the utmost secrecy, so as not to aggravate the
printer's Union.

It is important to note that both the Linotype and Monotype
companies offered with their products the matrices for new or
re-designed typefaces which were available for use with their
machines.

This promotion of new typefaces was notable in that it created a
demand for specifically designed fonts, created for a particular
purpose.   It began a system of corporate sponsorship for
typeface design.   One example was the design of the typeface
"Times New Roman", by Stanley Morrison, for the Monotype
corporation. **(Fig.4)**.

The next major change in newspaper technology came with the
invention of offset printing (1904), and photo-typesetting
(1933).

Offset printing or Offset Lithography is usually referred to as simply, "Offset." Offset printing uses a planographic (flat) printing plate and depends on the principle that grease and water repel each other.

> The process is called offset because the image is not transferred directly from plate to stock, but is 'offset' from the plate to a rubber blanket and then from the offset blanket to the stock. **(BAIRD, 1973 Pg.46)**

The process of photo-typesetting involves the assembly of the typographic elements of a page in film positive form on a transparent base. Proofs and one-piece film negatives can be made by contact exposure.

This new process of typesetting coupled with a vastly improved method of clear and efficient printing began to free the designers of newspapers from the physical restrictions of hand-set type, and also the mechanical restrictions of the hot metal type-casting machine.

We have seen how changes in technology can effect the basic form of a newspaper, and also some of the elements that go to make up its structure. To see how the new graphic technology may affect the form of the contemporary newspaper, we must look at the contemporary newspaper.

Before we do that, however, it is important that we ask certain questions about newspaper design in a modern sense. We have seen that one of the trends in this century as regards newspaper design, is that technology has enabled the designer to move away from the collective process of production. As Clive Ashwin says in his book The History of Graphic Design and Communication

> Design was a collective rather than an individual process. The rise of the graphic designer may be compared with the rise of the orchestral conductor, who by degrees forsook his place at the keyboard and his level with the rest of the orchestra, to acquire a level which was literally and metaphorically above the means of production of the orchestra ... this simile is valid in another sense, in that the nineteenth century printer, found himself grappling with technical problems, with his instrument and with the new music of the period which nowadays, at least for the professional musician, are overcome. **(ASHWIN, 1983 Pg.4)**

So one of the questions we must ask when we look at the interaction between the new technology, the newspaper designer and the method of design, is to what extent does the designer have control, in a sense, of the actual design? In other words, does the new technology and the design freedom that supposedly goes with it mean that there is an opportunity for the designer to be innovative as a whole, governed by a sense of historical precedence, in which case the new technology is more simply a vehicle for quicker, more efficient production.

The Daily Courant.

From the Harlem Courant, Dated March 18. N. S.

Naples, Feb. 22.

ON Wednesday laft, our New Viceroy, the Duke of Efcalona, arriv'd here with a Squadron of the Galleys of Sicily. He made his Entrance dreft in a French habit ; and to give us the greater Hopes of the King's coming hither, went to Lodge in one of the little Palaces, leaving the Royal one for his Majefty. The Marquis of Grigni is alfo arriv'd here with a Regiment of French.

Rome, Feb.25. In a Military Congregation of State that was held here, it was Refolv'd to draw a Line from Afcoli to the Borders of the Ecclefiaftical State, thereby to hinder the Incurfions of the Tranfalpine Troops. Orders are fent to Civita Vecchia to fit out the Galleys, and to ftrengthen the Garrifon of that Place. Signior Cafali is made Governor of Perugia. The Marquis del Vafto, and the Prince de Caferta continue ftill in the Imperial Embaffador's Palace ; where his Excellency has a Guard of 50 Men every Night in Arms. The King of Portugal has defir'd the Arch-Bifhoprick of Lisbon, vacant by the Death of Cardinal Soufa, for the Infante his fecond Son, who is about 11 Years old.

Vienna, Mar. 4. Orders are fent to the 4 Regiments of Foot, the 2 of Cuiraffiers, and to that of Dragoons, which are broke up from Hungary, and are on their way to Italy, and which confift of about 14 or 15000 Men,to haften their March thither with all Expedition. The 6 new Regiments of Huffars that are now raifing, are in fo great a forwardnefs, that they will be compleat, and in a Condition to march by the middle of May. Prince Lewis of Baden has written to Court, to excufe himfelf from coming thither, his Prefence being fo very neceffary, and fo much defir'd on the Upper-Rhine.

Francfort, Mar. 12. The Marquifs d' Uxelles is come to Strasburg, and is to draw together a Body of fome Regiments of Horfe and Foot from the Garifons of Alface ; but will not leffen thofe of Strasburg and Landau, which are already very weak. On the other hand, the Troops of His Imperial Majefty, and his Allies, are going to form a Body near Germefhein in the Palatinate, of which Place, as well as of the Lines at Spires, Prince Lewis of Baden is expected to take a View, in three or four days. The Englifh and Dutch Minifters,the Count of Frife, and the Baron Vander Meer, and likewife the Imperial Envoy Count Lowenftein, are gone to Nordlingen, and it is hop'd that in a fhort time we fhall hear from thence of fome favourable Refolutions for the Security of the Empire.

Liege, Mar. 14. The French have taken the Cannon de Longie, who was Secretary to the Dean de Mean, out of our Caftle,where he has been for fome time a Prifoner, and have deliver'd him to the Provoft of Maubeuge, who has carry'd him from hence, but we do not know whither.

Paris, Mar. 13. Our Letters from Italy fay, That moft of our Reinforcements were Landed there ; that the Imperial and Ecclefiaftical Troops feem to live very peaceably with one another in the Country of Parma, and that the Duke of Vendome, as he was vifiting feveral Pofts, was within 100 Paces of falling into the Hands of the Germans. The Duke of Chartres, the Prince of Conti, and feveral other Princes of the Blood, are to make the Campaign in Flanders under the Duke of Burgundy ; and the Duke of Maine is to Command upon the Rhine.

From the Amfterdam Courant, Dated Mar. 18.

Rome, Feb. 25. We are taking here all poffible Precautions for the Security of the Ecclefiaftical State in this prefent Conjuncture, and have defir'd to raife 3000 Men in the Cantons of Switzerland. The Pope has appointed the Duke of Berwick to be his Lieutenant-General, and he is to Command 6000 Men on the Frontiers of Naples : He has alfo fettled upon him a Penfion of 6000 Crowns a year during Life.

From the Paris Gazette, Dated Mar. 18. 1702.

Naples, Febr. 17. 600 French Soldiers are arrived here, and are expected to be follow'd by 3400 more. A Courier that came hither on the 14th. has brought Letters by which we are affur'd that the King of Spain defigns to be here towards the end of March ; and accordingly Orders are given to make the neceffary Preparations againft his Arrival. The two Troops of Horfe that were Commanded to the Abruzzo are pofted at Pefcara with a Body of Spanifh Foot, and others in the Fort of Montorio.

Paris, March. 18. We have Advice from Toulon of the 5th inftant, that the Wind having long ftood favourable, 22000 Men were already fail'd for Italy, that 2500 more were Embarking, and that by the 15th it was hoped they might all get thither. The Count d' Eftrees arriv'd there on the Third inftant, and fet all hands at work to fit out the Squadron of 9 Men of War and fome Fregats, that are appointed to carry the King of Spain to Naples. His Catholick Majefty will go on Board the Thunderer, of 110 Guns.

We have Advice by an Exprefs from Rome of the 18th of February,That notwithftanding the preffing Inftances of the Imperial Embaffadour, the Pope had Condemn'd the Marquis del Vafto to lofe his Head and his Eftate to be confifcated, for not appearing to Anfwer the Charge againft him of Publickly Scandalizing Cardinal Janfon.

Chapter 2

*The elements
of contemporary
newspaper design*

16

Before we can go on to discuss contemporary newspaper design as an overall thing, we must first explore and understand the various graphic elements that, working together, create the way in which a newspaper works. These elements can be defined in a series of general headings.

TEXT.

The text is one of the most important elements that go to make up the newspaper. The heading, text, can be further divided into two categories: body-text (that is, the type that goes to make up the main informational content of the newspaper), and headlines.

GRAPHIC DEVICES.

This is a less easily definable element. Graphic devices come in various shapes and forms, but a brief look at any newspaper page will help identify them. They are the lines, bars and rules that surround, divide or emphasise the other elements of the page.

ILLUSTRATION.

Apart from text and typography, the other main informational element is illustration. Illustration can be divided into two categories, photography and graphic illustrations (line drawings, schematics).

THE PAGE.

The least obvious and one of the more important elements in the structure of the newspaper is the page itself.   The size and shape of the page define the structure that the other elements take.   It may sound obvious, but the page is made up of white space, and the use of white space as a defining element is very important.

The process by which all these elements are arranged on the page is called "Layout."   The layout creates and defines the way in which the elements of a page, and indeed the whole newspaper will work to fulfil the design and editorial briefs, to present information in a logical, readable manner, while maintaining and re-remphasising the character of the newspaper.

These, however, are brief and sketchy definitions of the important elements that make up the newspaper page.   It is necessary to look at each of them closely, before we can discuss some of the reasons and theories that justify their use, and before we can relate how the use of new technology may possibly affect newspaper design.

We have already defined the two main categories of type which make up the typography of a newspaper, that is, body-text and headlines.   For the moment it is enough to state generally what sort of typestyles are used for each category.

For body-text practically all newspapers use classic script type faces. To be more specific, many of them use the same or relatively similar fonts.   For example, Rolf F. Rehe notes that many American newspapers:

'Use Crown or Corona as their principle text typeface **(REHE, 1990, Pg.117)'**

Fonts used for headline typography tend to be more contemporary, in that many newspapers now use sans scrip typefaces, as a sole display face or used with another serif, or slab serif face (for example, Bodani) to create contrast and differentiation between articles.

The format of how text is laid out is regulated by the use of a grid. Most newspapers design their pages by using a master template or dummy **(Fig 6)**.   The grid on the page defines the length of the line in a single column, so most columns are the width of, or a multiple of part of the grid (although there are exceptions to this, in various circumstances), as Rehe states:

Depending upon the type and size, an optimum line length for newspapers is somewhere between 12 and 15 picas. **(REHE,1990, Pg. 117.)**

This is generally agreed upon by many designers in the United
States and Europe.

> 'Most newspapers in the U.S. are now being designed on a six
> column grid. **(REHE, 1991 Pg.117) (Fig.7).**

That is not to say however, that the six column grid is used, or
even accepted universally. for instance, of the four newspapers
selected for critical analysis in this thesis, only one uses a
siz column grid (THE IRISH PRESS, a tabloid).   All the others
use eight column grids (10 picas wide).

So, as we see, opinions about exact optimum column width differ.
It is generally held that the impact and perception of any type
style used for body-text will be affected by column width.   Rehe
states in his article **Newspaper Typography: Some Do's and
Don'ts.**

> Short lines force the reader's eyes to spend too much time
> travelling back and forth on the page.   Excessively long
> lines become monotonous and tiring to the eye.
> **(REHE,1990, Pg.116).**

This opinion has more or less been proved as fact by research into optical perception.   As Linda Reynolds states in her article, <u>The Legibility of Printed Scientific and Technical</u> <u>Information</u>:

> Line length may be varied within broad limits without diminishing legibility, but research has shown that very short lines prevent maximum use of peripheral vision.   This increases the number and duration of fixations and hence total perception time.   Very long lines cause difficulty in locating the beginning of each successive line, and the number of regressions after the backsweep of the eyes at the end of the line is greatly increased (in Tinker, 1963).

21

> These effects are especially noticeable in the very short lines of some newspapers, and in the very long lines of up to 132 characters which are typical of many kinds of computer printout.   The effect of short lines is particularly severe with large type sizes, as is the effect of long lines with small type sizes.   Line length cannot be determined independently of type size therefore.   **(REYNOLDS, 1990 Pg.210)**.

However, these general rules are not universal in their application.   It is not enough to say, for example that 12 picas is an optimum column width, and then to go ahead and set the body-text in the first type style that you find.   For while Europe and America both use standard systems of measurement to define type sizes (Didot point system etc.)fonts still differ in their basic proportions.

For instance the x-height of 9/10 - Aurora is not the same as
the x-height of 9/10 Century Schoolbook. **(Fig 8)**.
Nor should it be, for this would place restrictions on the
individuality of particular typefaces.

Following on from this, we can see that practically speaking,
some typefaces are more suited than others for particular uses.

These considerations inform the decisions many designers make as
regards choice of particular typefaces for particular roles, not
only in newspaper design, but in the whole area of printed
communication and graphic design.

Having seen how the presentation of the basic informational
content of any newspaper page is affected by the grid system, we
must now analyse some of the other elements on the page before we
view it as a whole.

Illustration has always been seen as an important element in
newspaper design.   As Allen Hutt states in his book: <u>Newspaper
Design Today</u>:

　　　For most of us the illustration is the third basic
　　　ingredient, after type and white space, in the make-up of the
　　　page. **(HUTT, 1987 Pg 121)**.

We have already defined the two main categories of illustration.
First of all, let us look at the photograph, or to be more
specific the half-tone photograph.

The raw photographic material that arrives at a newspaper is
subjected to many design decisions.   Photographs are cropped,
stepped, enlarged or reduced.   Whatever happens to them in a
physical sense, however, is governed by the method and design of
the layout process.   As Hutt states:

> Most pictures reaching the page planner will be slightly
> off-square, of 10:8 proportion or similar, either vertical or
> horizontal, and when the proportion changes through cropping
> to increase the vertical or horizontal stress the result
> will be a better picture. **(HUTT,1989, Pg.121).**

By a better picture, he means that in terms of the overall
layout, once the proportions of the picture have been modified,
it will fit into the page in a more cohesive manner.

Hutt does make a provision to the above statement, saying that it
only applies if the cropping is done properly. And it is true
that cropping is very important for many reasons.

For instance, it must be seen that a photographer, when taking a
photograph cannot, and does not take that photograph bearing in
mind the exact process by which it will be manipulated and
changed by the page-planner and designer.

Even an experienced press-photographer cannot foresee the exact
shape that a final page layout will take, even as the designer
does not know. He may be familiar with a paper's particular
layout method, but it is not his job to actually do it.   The
photographer's job is to take photographs of a particular event
or subject.   He creates the raw material. It is the designer
and page-planner who manipulate the photograph, the piece of
information, to fit the brief, that is, the objectives of the
page.

The designer changes the picture to relate it to the page.   It
must be remembered that a photograph is a piece of visual
information, and to change it, is to change the meaning of that
information, or present it in a different manner.   In the
process of manipulation the designer can reveal or disguise part
of the information of the picture.   He can select a photograph
to tell a certain piece of information, to reinforce or clarify
another piece of information - or let it stand on its own, so
that it can be read as if it were another column of text.

This is, in a sense an encapsulation of what the designer does
when he creates a layout, or a method of layout for a
page-planner to follow.   He defines a structure, around which
the body of the newspaper will be built. And since the designer
creates the way in which the reder will perceive it, not only the
actual information on the page, but the tone and character of the
page, and the newspaper as a whole.

The oldest, and now least commonly used method of layout, is that
of vertical make-up (FIG.9).   In this method, the page is
divided into a series of columns, and these columns are then
filled with single-column stories.   The reasoning behind this is
explained by Allen Hutt:

In the nineteenth century, the news was told as it happened,
in chronological order; it made good sense to begin at the
beginning, at the top left of the page, and fill the columns
one after another, story by story, until there was no more
space. (HUTT,1989, Pg.39).

Another method of layout, elements of which are still used (see
the Guardian etc..) is horizontal layout (FIG 10).   Horizontal
layout is generally favoured for long stories, the premise being
that when the text runs in a series of short blocks across the
page, it is easier for the eye to make the connections from the
bottom of a text block to the top of the next.   As Hutt says:
'It is rather like the style of a book; where the reader gets
a rest at the bottom of each page.'

Indeed, this method of layout, and the reasoning behind it has
affected other more contemporary designs, in that designers tend
to try and break up a page if it begins to look like a vertical
layout.

Diagonal make-up is a method of layout which has more to do with the reader's perception of the whole page as pieces of information than the two previously described. The basis of this method is simple enough. It is designed from the point of view that every reader, on first looking at the page, is not going to look at the top left hand side of that page. There is no predicting what direction from which the reader's eye is going to "come into" the page. Thus diagonal make-up is designed so as to place no particular chronological or informational priority on any story. Rather, it is argued, it encourages the reader after reading the first article, to look around the page.

> Whatever the reader sees first is immaterial; the important thing is that after seeing that element, the reader will be inclined to look around the page in a clockwise direction, and that will be helped by the diagonal arrangement and its movement. (HUTT,1989, Pg.37).

One of the more commonly seen and obvious layouts is quadrant layout. By obvious, I mean that the basic make-up structure of the page is shown in its design. The term Quadrant is, in fact, something of a misnomer. It does, however give some idea of how the page is laid out. The concept behind the method is that every element can be seen at one glance. The page can be divided into two, three, four or five positions, as long as each element or feature stands out strongly. Allen Hutt quotes another name for this style, calling it a "Four Ring Circus," meaning that you can see all "the Acts" at the same time. Whether he meant this in a derogatory sense is unclear (FIG11).

Modular make-up is the layout process which aligns itself closely
to the philosophy of designing the page as a whole.   Modular
make-up stems from the premise that the page, being rectangular,
can be broken up into a series of smaller rectangls, each
containing one element.   Following on from this, related
elements may be drawn together to form a further rectangle.   In
modular make-up, the designer does not have to work around
problems of his own making.   For instance, putting a story into
a page and then trying to work out what else to put beside it.
Rather each step creates a position for itself and the next
element.   Because each element has one basic thing in common, the
rectangular shape, it is easier to place them in relation to each
other.   As Allen Hutt states:

    'It is a lot quicker to build a wall with bricks than with
    assorted rocks.(HUTT, 1989,Pg.40)'

So having discussed several of the more prominent methods of
layout, we should now look at what they are designed to achieve
and what they actually achieve.

Chapter 3

The new graphic technology.

A layout consists of a number of elements placed in such a manner as to relate to each other in a logical fashion. This logical placement and our reading of it is defined by all the elements described previously. These graphic elements create a visual set of guidelines which we read along with the body-text. They tell us which areas of information are related and which are separate. For instance, we know which is the main story, not by reading the body-text, but by seeing the headlines, which are placed in a manner which will be obvious to us.

The readers know, for instance that series of articles are about the same subject, because they are told so, by means of a thick black rectangle which surrounds the area in which they are placed.

In a sense, these graphic elements, this structure of definition, is telling the reader which way to read the newspaper. And in so doing, it can emphasise the tone of the newspaper, its character, in a non-linguistic manner. That is to say, that we can read visual signs from the newspaper that tell us what it is all about. Not the information contained within the newspaper, but rather the point of view of the newspaper, its ideological position, its values and priorities.

The most obvious example of how this process works is the tabloids, or to be more specific, English tabloid newspapers such as THE SUN or THE STAR. Having looked earlier at one of the more prominent methods of layout in the area of tabloid newspapers, we can see that one of the main priorities of the tabloid newspaper is to attract the attention of the reader, and to entertain him. **(FIG.13)**

To this end, the layout of a tabloid newspaper has to be simple
and direct.   To fulfil the design and ediatorial brief
completely, the layout must show the reader exactly what the
newspaper "thinks." The reader is told what sort of priorities
the newspaper assigns to various pieces of information.

To understand this process it is necessary to analyse specific
newspapers, to define their tone and character and see how this
is expressed in their layout.

However, before we can begin to discuss how specific examples of
newspaper design work, and how they can be and ar affected by the
uses of new graphic technology, we must first look at the
attributes of some of this technology.

As we have seen already, newspapers, newspaper design and graphic
design have been affected before by major technological changes.

Apart from the actual invention of the printing press itself, the
majority of these changes have had little effect on the basic
processes of information layout as a whole.   The main effect was
to increase the output of the printing presses by making them
more efficient and cost-effective (rotary printing press, etc..).
So what makes the advent of computer aides graphic design any
different?

Jan V. White states that the new technology is just
        one more event in the long and proud history of human
        communication ... the newest link in a very long chain
        (WHITE, 1988. Pg.IX).

If, however, we are to take this statement as fact, then it is possible to make the assumption that because each change of technology has its roots in previous changes, it is part of some inexorable march of progress, that in fact each change is inevitable, and that the technology of a system of production (such as the design and production of a newspaper) determines, not only the shape of that system, but also that of the product.

As was stated earlier in this thesis, this point of view can distort an objective view of the new technology in relation to the system of design and production of a newspaper.

While it is true that the technology used in the production of a newspaper affects the form of the newspaper to some extent, it is important for us to discuss the possibility that the new technology allows the designer to explore the various possibilities of his profession without being as tied to the physical reality of the printing process as he previously was.

What are the processes that have been brought into being by the advent of the new technology? What areas has it affected most?

Broadly speaking, it is possible to divide the areas of design that have been affected by new technology into two.

The first area is typography, and the manipulation of letterforms and their characteristics. The second area incorporates the first as one of its elements, but in the contect of this discussion, can be defined separately as layout.

Let us look at each of these areas in turn, and discuss the various attributes of new graphic technology.

First of all typography. As we have seen there are various schools of thought about the appropriateness of certain typefaces for certain functions, and also there are various differing opinions on optimum line length in a newspaper, legibility and printability etc..   And, as we have seen, there are literally thousands and thousands of styles and variations to choose from.

A designer eliminates many of these choices by following whatever rules of typography he may adhere to, arriving finally at a choice which appeals both in a functional and aesthetic sense. But what happens of there is no existent type style that has the attributes the designer is looking for?   He must design it himself, or commission someone to do it for him.

Before the advent of computer aided graphic design, custom
designing a new typestyle was a difficult task, involving long
hours of specialised craftsmanship.   In order to see how
computer aided design can help the process of custom designing a
typeface, it is helpful to look at a specific example.   Rolf F.
Rehe describes such a situation.   Rehe, when creating a new
design for the West German Paper, THE RHEINISCHE POST had
selected Bookman as the most compatible typeface.   However, he
found that existing examples of the font were too heavy or too
light.   He also needed to change the appearance of some letter
characters, the capital letter "Q" and the German double "s" to
better reflect their conventional usage.   Rehe drew on the
talents of a West German company called U.R.W.   They set about
producing a typeface which remained faithful to the original
Bookman, while incorporating the elements which Rehe needed.

U.R.W. used their own IKARUS software to create the typeface.
IKARUS differs from other widely used typeface software like
Fonatographer (designed by Altsys Co.) in that characters are
described on screen, using x and y co-ordinates along a contour.
(Fontographer uses a bezier curve-based draw programme).
   (FIG.14)

The following is a brief description of the process which the company used:

The original characters, which have a cap height of 10 centimeters, are marked along their contours at specific points. A computer mouse is used to "click on" these points, recording the exact position on an x, y coordinate ... corrections are done on a high resolution graphic screen, with each character tremendously enlarged. Again, the mouse is used to indicate the exact points where modifications are to be made in the contours of each character ... Proof checking creates a formal checking of the character editing. These proofs are printed on a high resolution flatbed plotting machine, capable of drawing each character to a size of 10 centimeters with the accuracy of a 1/1000 of a millimeter. These are compared with the original type specimen. If the result is perfectly accurate, the copy can be processed electronically.

Once the type has passed the proofing stage it:
can be imaged onto photo-sensitive paper, directly from the electronic characters stored in the computer. (**REHE, 1991, Pg.121**).

Another example of the custom type design using new technology (this time the main software is Fontographer), is given by Roger Black and David Berlow in "Step by Step Graphics."   Black was engaged in redesigning the weekly magazine section of THE CHICAGO TRIBUNE.   He needed a condensed serif style to serif style to serve as a headline face in this supplement.   The style he was looking for needed :

the compression of a Century condensed with more weight and 'flair' than versions that were available.

This flair included lighter serifs, flatter round shapes and less rigid alignment of horizontal strokes.

Another major consideration was that the newspaper made extensive use of its Apple Macintosh system (coupled with a Postscript typesetter).   Therefore the new font had to be compatible with this system.

Using a Mac II computer and Quark Express software, Black created a page of the New Century Schoolbook (the face on which the new style was to be based), at 72 points, but scaled to 75 per cent of its normal width.   Then after scanning this page with a high resolution flat-bed scanner, Black selected the upper case 'M' as a prototype character.   Using this bitmapped image, Black then created a template width with which he was able to create an outline of the character with the desired modifications.   This outline was then sent to Berlow; together with Black's notes and artwork pertaining to the desired features.

Using the same scanned artwork that Black had used to select
the 'M', Berlow cut and pasted all the scanned letters into
the Fontographer as character backgrounds, and began the
process of making an outline font. **(BLACK, 1990, Pg.135).**

After the final version of the font was approved by the
newspaper, Berlow extended the character set to 'include all of
the letters and symbols needed for a major newspaper.'

Also using the Fontographer software, Berlow created about 150
kerning pairs.   Kerning is creating an exception for certain
conbinations of characters (e.g. 'LT,' 'TO' and 'AV') from the
general spacing requirements of their parent typestyle.   It
creates efficient use of space, and is generally held to increase
egibility and cohesivness. **(FIG.15).**
In conclusion:
    the project was completed with the delivery of a
    final font to the Tribune for full testing in their own
    environment.   This environment includes Macintosh computers,
    laser printers for proofing and Linotype Postscript
    typesetting equipment.

Having looked at two specific examples of newspaper typography,
designed using the new technology, we must now try to see some of
the ways in which these processes can affect the manner in which
typestyles are created, and the manner in which they are
perceived.

What governs a choice of typestyle for a particular purpose? As we have seen earlier there are various schools of thought regarding many of the issues that concern typography, and typographers. As we have also seen, there are practical restrictions which govern the use of certain fonts in newspaper typography (narrow but not condensed etc..). But not all restrictions about the use of certain typestyles are purely practical. There are other things to be taken into account.

For example, generally speaking, body-text in a newspaper is made up of a serif-style typeface (as we have seen earlier). The argument for this and the justification of its use can be summarised in one word - legibility. Many designers say that the individual serif character is innately more recognisable because of its serifs, i.e. they emphasise its form.

However, there is little scientific evidence to prove that this is fact true. Indeed, Linda Reynolds, in her article - Legibility of Printed Information states quite the opposite:

> It would seem that there is very little difference in terms
> of legibility between the typefaces in common use when well
> printed, and that familiarity and aesthetic preference have
> much to do with any observed differences in reading speed.
> (REYNOLDS, 1990, Pg.197).

She also goes on to state that regarding the relative legibility
of seriffed and sans-seriffed faces:

> It would seem that any differences in legibility in favour of
> seriffed faces may be due to familiarity rather than to any
> intrinsic superiority. **(REYNOLDS, 1990, Pg.198).**

So we see that there is very little justification in choosing a
serif face because it is innately more legible. The only reason
that this type is any more legible than a sans serif face, is
because the reader is familiar with its general shape and form.
the reader recognises it as something he has seen before, and
doesn't have to spend reading time analysing the face, figuring
out which character is A and which is B.

45

Typefaces and the various family groups of related fonts have
individual characteristics, and to each of these faces there is a
tone.   That is to say, that the reader associates different
meanings to a particular style of the faces.   The form of
different typefaces imposes a certain meaning and connotation
upon a body of text, regardless of what information is conveyed
within that text. So, in relation to newspaper typography, it
would be a mistake for a newspaper designer to choose a typeface
for a newspaper which had connotations that were directly opposed
to the overall tone of the newspaper.   So although the
contemporary newspaper has the means to create new typefaces and
to modify old ones to suit a certain job, he must be careful to
realise that this manipulation can change the tone and character
of the information contained within the newspaper, the tone of
the newspaper itself, and the readers' perception of both.

As we have seen, layout is the process by which the major
elements of a newspaper page are fused together to create that
page.   What are the processes by which new technology can
affect page layout?

Before we can discuss this however, we must define the two
intermeshed design processes which create a layout in a
newspaper.

There are two design processes which create any given newspaper.
The first of these is the actual design of how the paper will
look, the design that will set the visual tone of the newspaper.
At this stage the designer will decide the format of the
newspaper, which typefaces to use for body and display text, what
order the pages will go in etc. At this stage the design
priorities of the newspaper are decided.   Will it be a
broadsheet or a tabloid.   How will it use illustration, and what
form will that illustration take.

The other design process if the following through of the original
template on a day to day basis.   Starting with the information
provided by the writers and journalists it is the
minute-to-minute arrangement and re-arrangement of stories,
columns and features into their various places and shapes, and
finally the layout, which puts them into context as pieces of
information.

In a totally computerised newspaper, the design process system
looks something like the diagram shown in Figure 16.   The
journalists and writers have direct text input.   That means they
can write their articles etc., directly into the mainframe of the
computer.   This information is stored in memory where it can be
accessed by editors and sub-editors at the editing terminals.
Graphics including digitalized photographs and computer
originated artwork are also stored in memory.

Even while articles and graphics are being filed, the designers
and sub-editors are fitting the information into a clearly
defined layout. Using software like the Quark Express programme,
the designer can layout an entire page, and indeed the whole
newspaper on screen.   That is to say, that at this stage of the
process, the entire newspaper exists only on magnetically stored
information in the computer system's memory.   In this way the
entire system of informational priorities (i.e. which story goes
where, what story is the leader, what needs to be edited, etc.)
remains fluid until the very last moment.   At this time each
finished page layout is assigned its order in the sequence of
pages.   This information is then transferred to computer
typesetting equipment such as Linotype Postscript.   This material
is then scanned by laser to create a plate for printing, or fed
directly into a compatible computer driven printing equipment.

But what are the advantages as regards other important elements of the newspaper, such as photographs? Many of the larger Press agencies such as Reuters, Associated Press and the Press Association are now 'on the verge of going over to digital technology.' This involves digitalising a particular photograph and transmitting to subscribers via a digital transmaitter (hooked up to satellite), such as the Hasselblad Dixel digital phototransmitter. An article in the graphic technology magazine 'XYZ' reports that titles such as THE SUN, and TODAY are at present using a Dixel. The availability of up-to-date photographic material from places such The Gulf is obviously very important to illustration orientated newspapers such as these.

Newspapers which have gone over to full computer pagination can also take advantage of this method of acquiring photographs, as 'XYZ' reports:

> Chosen pictures can be sent directly into a page assembly system and output with the full page on an image setter. The resulting quality is much better than scanning a wirephoto print. **(XYZ, 1991. Pg.8).**

From this brief description of computer aided design, it is
possible to see what the attributes of on-screen layout are.
First and foremost is the fact that the designer and sub-editor
are able to get away from the physical restrictions of paste-up
layout.   That is to say, they are no longer bound by the limits
of having to have copy set, photographs cropped mechanically,
pasting up a provisional layout, having a proof made, and then
having to do it all over again when some piece of information was
assigned a different priority.

Also, when a page is assembled on-screen, and is so eary to
change and modify, there would seem to be more room for editorial
in-put and criticism.   In a sense, the layout artost would no
longer have such a share of responsibility for the look of a
page.   Thus the process of layout can become less specialised
and more of a group effort, in the sense that more people
concerned with the actual information contained within the page
have a greater influence on the manner of presentation of that
information, and, following on from this, the manner in which
that information is percieved by the reader.

One of the possible dangers of this intermingling of design
responsibility, is that the focus of the original desin, the
template, is shifted or lost.

However, to speculate on how the design process can be affected
by such methods remains insubstantial without the comments and
opinions of contemporary designers.

The new Scottish national Sunday newspaper, THE SUNDAY SCOT, is
a prime example of an almost totally computerised design system
working within a newspaper organisation.   XYZ reports that:
    Journalists will key in copy on PC's running GB techniques,
    Mentor software. Pages will be made up on Macintoshes using
    Quark Express... Finished pages are output to two Monotype
    ExpressMaster image setters with PS4000 Postscript KIPS
    connected by the Monotype Laserbus network. **(XYZ, 1990.
    Pg.12).**

A plethora of technical terms indeed, but the basic description is
almost exactly the same as the one given in the previous page.
But how do people who are going to work within this system feel
about it?

The SCOT ON SUNDAY Editor-in-Chief, Tom Cassidy believes that
the combined traditional and desk-top system gives the speed and
flexibility needed to launch the newspaper, while at the same
time will allow them to expand rapidly into the daily market.
(XYZ, 1990, Pg.12).

Enthusiastic words indeed.   The main argument in favour of
on-screen layout from Cassidy's point of view seems to be speed
and flexibility.   In an interview with DESIGNER magazine,
David Driver, Head of Design at THE TIMES, (at the time of that
paper's move to new Headquarters at Wapping) disagrees with this
point of view.

    At TODAY page layouts are done on-screen, a method Driver
    politely considers to be 'madness,' and in any case quite
    inappropriate for a broadsheet newspaper such as THE TIMES.
    "Everything must be keyed in before you can design a page,"
    he explains. "Imagine the overload in trying to design a
    "Times" newspage on-screen." **(DESIGNER, Oct.1986 Pg.25).**

Driver goes on to state that he feels some newspapers (such as
TODAY) tend to place an excessive reliance on new technology to
such an extent that they lose sight of the real issues.

    "It is easy to be seduced by the attractions of direct input,
    and ignore the hard questions like: Who is this newspaper
    for? What is it going to do?, and, What geography does it
    have?" **(DESIGNER, Oct.1986, Pg.26).**

A compromising approach is adopted by Whittam Smith, Editor of
the revamped INDEPENDENT, in the same article.   He considers
direct input of journalists copy as a revolution in its own
right, but does not feel that the INDEPENDENT should be
designed totally on-screen.

The article states that:

> The INDEPENDENT will half do this by laying out text
> on-scareen and producing a bromide, then pasting on
> advertisements, graphics and pictures.   Unlike Eddie Shah
> [founder of TODAY], Whittam Smith does not believe the
> technology is good enough yet to do everything on-screen.
> **(DESIGNER. Oct.1986,Pg.30).**

Chapter 4

*An analysis of
some contemporary
newspaper titles*

The four newspapers chosen for analysis in this thesis are, THE
IRISH TIMES, THE IRISH INDEPENDENT, THE IRISH PRESS and THE
GUARDIAN.

The main analysis will be concentrated on the three Irish papers,
THE GUARDIAN being used as a contrast.   As an English
newspaper, it competes less with the others in a marketing sense,
and obviously treats stories according to different news values.
For this reason it is possible to compare and contrast the
different design criteris (and the editorial briefs that affect
them), in a more objective manner, as THE GUARDIAN does not
compete with the Irish newspapers in the market place.

A newspaper sells itself to a particular audience by various
means.   The way it looks is one of the most important.   As we
have already seen, the way in which a newspaper is designed
affects the overall 'tone' of the newspaper.

A newspaper may acquire its image over a period of time, and thus
acquire certain connotations about its character.   As readers
become familiar with its structure, they become used to it - it
becomes "their paper."

In such a case, the newspaper must strive to maintain its familiarity, and with it, its readership. This is, in itself a design brief, something that a designer must be aware of if he is to contemplate any change in the structure of the newspaper, for whatever reason.

This is, of course, only one simple example of the kind of factors which effect the design brief of a newspaper. In order to consider other factors, and to possibly discover how the design decisions they govern work (or don't work), let us look at our four contemporary titles.

All four newspapers are published daily. Without delving into their respective histories, it is possible to say that all are relatively established newspapers. THE IRISH TIMES, THE IRISH INDEPENDENT and THE GUARDIAN are all broadsheet newspapers, while THE IRISH PRESS converted to tabloid format in 1988.

As regards the use of new technology, each of these papers differs. While all the Irish papers mentioned use computers to out-put the main body-text and headlines, only THE IRISH PRESS uses direct input (mainly for advertising copy). None of the Irish papers use on-screen layout systems, although the IRISH PRESS has plans to switch to a system of on-screen layout for modular sections.

THE IRISH INDEPENDENT uses a modular layout system, based on an
eight column grid.   Practically all its informational text is
set in a serif typeface (both headlines and body-text).   The
headline policy seems to be the use of a bold serif for main
headings, with a lighter stab-serif face for related or
subsidiary information.   This seems to work on single feature
pages (FIG.21). However, on pages that contain several
different items, the use of bars and boxes to define the priority
of an article would seem to render superfluous the use of the
second typeface.

The use of bars and boxes is in itself interesting.   While the
use of such elements in defining and separating pieces of
information is a well proven technique, here it seems to break up
the white space that defines separate columns, therefore adding
to the overall greyness of the page.   To combat this lack of
definition the leader articles are set in a heavier weight than
the main body-text, which is extremely difficult to read.

Overall there is a general feeling of an indecisive use of
resources.   The dense body-text is difficult to read, and white
space is generally not used as a defining element. This gives the
white space on the page a feeling of un co-ordination.   One
example of this is the front page.   Here there is a large area
of white space above and around the masthead, which leaves the
masthead (any newspaper's most immediate identifier) floating,
and unconnected to the rest of the page (FIG.22).

To state categorically what the overall tone or charcter of THE
INDEPENDENT is, is difficult in a sense, because of its
inconsistency.   It is hard to identify an overall design
strategy.   This is not to say, however, that the paper does not
work.   It is a perfectly competent newspaper which uses
established methods of layout and design.   But it is diffucult
to see if it is heading in any particular direction.   So while
new technology does not play a role in its design, its lack of a
clear design stgrategy may make it difficult for it to combat
that technology's effects on its competitors.

THE IRISH PRESS is a newspaper which has recently undergone a
radical change in format, as is already stated.   The reason this
this as revealed by sources within the newspaper, was to attract
a new, younger audience.   The change, however, seems to have had
a negative effect on the paper's circulation.

The Audit Bureau of Circulation figures for THE IRISH PRESS for
the period January/June 1988 are 79,108 (seventy nine thousand
one hundred and eight).   Compared with figures for the period
between July and December 1983 90,996 (ninety thousand nine
hundred and ninety six) **(MAPS, 1984, Pg.10),** this shows a
dramatic drop in circulation which coincides with the change from
broadsheet to tabloid.   Furthermore, Production Journal, the
journal of the Newspaper Society gives the circulation figures
for THE IRISH PRESS in 1991 as 65,000 (sixty five thousand).
(Production Journal, Feb 1991, Pg.33).

To state categorically what the overall tone or character of THE INDEPENDENT is, is difficult in a sense, because of its inconsistency. It is hard to identify an overall design strategy. This is not to say, however, that the paper does not work. It is a perfectly competent newspaper which uses established methods of layout and design. But it is difficult to see if it is heading in any particular direction. So while new technology does not play a role in its design, its lack of a clear design strategy may make it difficult for it to combat that technology's effects on its competitors.

THE IRISH PRESS is a newspaper which has recently undergone a radical change in format, as is already stated. The reason this this as revealed by sources within the newspaper, was to attract a new, younger audience. The change, however, seems to have had a negative effect on the paper's circulation.

The Audit Bureau of Circulation figures for THE IRISH PRESS for the period January/June 1988 are 79,108 (seventy nine thousand one hundred and eight). Compared with figures for the period between July and December 1983 90,996 (ninety thousand nine hundred and ninety six) (MAPS, 1984, Pg.10), this shows a dramatic drop in circulation which coincides with the change from broadsheet to tabloid. Furthermore, Production Journal, the journal of the Newspaper Society gives the circulation figures for THE IRISH PRESS in 1991 as 65,000 (sixty five thousand). (Production Journal, Feb 1991, Pg.33).

Based on a six column grid, THE IRISH PRESS uses a honed-down
modular layout system.   Honed down in the sense that there is a
much lower story count per page.   This means, however, that the
six column grid is sometimes sacrificed on feature pages to allow
for an expanded column width.   This expanded column witdth
device is also used to create blocks of priority information, or
to emphasise shorter articles and give them the same sort of
priority as adjacent articles, which are longer, but set on the
six column grid **(FIG 24)**.

THE IRISH PRESS also uses rules and boxes of different weights
to define articles. In some cases this can over-emphasise a
piece of information that has already been singled out by use of
an expanded column width.

Photographs are also generally boxed. This can help to define an
illustration when its overall quality is grey, but bad cropping
sometimes results in a badly registered, shoddy appearance
(FIG 25).

THE IRISH PRESS's use of headline faces differs from THE IRISH
INDEPENDENT's in that THE PRESS makes use of bold sans serif
headlines, especially on the front page.   Over use of this face
(Helvetica), and hence a lessening of impact as the reader
advances through the paper, is avoided by the use of a medium
weight serif.

As with THE INDEPENDENT there is a use of Bold type for
body-text, which makes for diffult reading; but smaller column
width (9 cms.) and better definition of columns can counteract
this.

Generally, THE IRISH PRESS seems to be achieving its aim of
having a fresher, younger sort of image.   The main design
problem it would seem to be facing at the moment is that while
its design structure is greared towards the flexibility of the
new technology, it has not actually switched over.

Production Journal states that THE IRISH PRESS has:
    Placed an order with System Integrators U.K., for a
    146 terminal editorial and advertising system.
    (PRODUCTION JOURNAL, Feb.1991, Pg.33).

This system is not a system designed for complete design
facility.   Rather, it is what is known as a front-end system.
That is, it is designed for direct input from journalists and
editors, though it does have "soft" type setting features.
Sources within the newspaper have said, however, that there are
plans for comouterised layout of modular sections, meaning that
while the final layout would still be pasted up, as it is now,
the main modules or sections, would be put together using the new
technology.

So we see that whole the elements and structure of the newspaper are being put together using traditional methods, the basic format of the paper is geared towards the use of new technolgy. THE IRISH PRESS is, in a sense, at a cross roads, as regards its method of design and production.   This has created a lack of cohesiveness in its design and therefore, its image, which may account for the recent losses in readership.

Inconsistency is not a problem that features regularly in THE IRISH TIMES.   THE IRISH TIMES uses a modular layout system, and like THE IRISH INDEPENDENT, is based on an eight column grid.   There is a predominance of serif faces for most of the text, the body-text is set in Times New Roman, while the headline copy is set in either Times or, like THE IRISH PRESS, Bodini.   Unlike THE IRISH PRESS, there is an obvious strategy towards the use of headline faces.   Bodoni is generally used for news features, while Times is used for lower news priority articles.   The strategy would seem to be that Bodoni, as an unrelated face to the body-text, would hence emphasise that text.

There is a much more restrained use of rules and bars, when emphasising informational blocks.   There is a tendency to separate blocks in a horizontal manner, which does much to give a clearly defined pattern to the page (i.e. it does not interfere with the vertical direction of the columns of text and white space).

THE IRISH TIMES also uses extended column widths for leader
articles, and informational columns.   This seems to help convey
a reserved tone to the newspaper, in that headlines don't have to
'shout' all over the page in order to emphasise a story or
article. **(FIG.26).**

THE IRISH TIMES differs from its competitors as regards its
overall charcter.   This is because, as the oldest of these
papers, it has acquired a somewhat institutionalised image.   It
is percieved as traditional.   As Michael Cunningham, Sub-Editor
with THE IRISH TIMES, said during an interview I conducted.
"It is a paper of record."

65

This image of being a 'paper of record' is prevalent, not only
among its readers, but also withint the organisation.   There is
a strong sense of this tradition within the design and production
system of the newspaper. "It seeps out from the walls," states
Cunningham.

With this strong sense of the newspaper's identity and purpose
ingrained within the organisation, it is obvious that self-image
largely dictates what sort of design systems and finished designs
are used.   Within a newspaper with a well-established image and
readership there is a fear that any form of radical re-design
will change that image, thus alienating the readers. Following
on from this, there is the argument that the switch to the new
technology and total computerisation would induce this sort of
alienating re-design.

Presumably this is one reason why there are no major plans for an
immediate technology switch within THE IRISH TIMES.
Any computerised graphic technology in THE IRISH TIMES is used
for basic typesetting or illustrative artwork (using an Apple
Macintosh). There is no use of direct input or on-screen layout
facilities.

Cunningham also suggested another reason for not completely
switching to the new technology. He feels that while the new
technology has a certain flexibility and speed, the old technolgy
has a 'rhythm' of its own, and that using the old technology
instils a sense of 'discipline and reflectiveness.'

THE GUARDIAN is an example of an established newspaper that has
undergone a radical re-design (incorporating new technology),
while managing to retain an established readership.

THE GUARDIAN was re-designed in 1988 by David Hillman, of the
design company Pentagram. There were several reasons for this
re-design. One of these reasons was that the paper had to
re-emphasise itself in the face of major re-designs by its
competitors, most notably THE INDEPENDENT (not to be confused
with THE IRISH INDEPENDENT).

Another reason is stated by Paul Luna in his article A Newspaper
for the Nineties,

> The re-design was needed, not only to combat loss of readers
> to THE INDEPENDENT, but also because technology could now
> overcome the crowded, nuddles sequence of pages which had
> resulted from the paper's success in attracting classified
> advertising **(LUNA, April 1990, Pg.54)**.

THE GUARDIAN uses a modular layout system based on a modified
eight column grid.   The grid is modified in the sense that,
apart from the usual vertical divisions, Hillman also created
twelve horizontal divisions.   Each cell is ten picas square,
except at the top.   Luna states Hillman's explanation of this:

> Hillman explains that the purpose of the vertical grid is
> that 'the paper gains in lucidity by looking planned across
> whole spreads,' meaning that alignment of stories are bound
> to happen at intervals throughout the paper. **(LUNA, April
> 1990, Pg.54)**.

The grid and sizing restrictions also control the amount of white
space between the headlines and the body-text, which is one ofTHE
GUARDIAN's distinguishing elements.

The body-text itself is set in Monotype Nimrod 814, set in 8 on
8.50 point.   This compression gives the text a vertical sort of
appearance which 'is reinforced by the lack of white space
between lines and between columns.' **(LUNA, April 1990 Pg.54)**.

The overall look of the paper can be very formal and pre-planned.
Indeed much of the criticism focused on the paper's re-design
concerned a perceived lack of spontaniety.   Paul Luna quotes
Clive Irving (involved in the design of THE OBSERVER and THE
SUNDAY TIMES), as asserting that :

> certain design elements take away from the feeling of
> immediacy because they look too planned. **(LUNA, April 1990**
> **Pg.54).**

On the other hand, this planned look reflects the editorial brief
that Hillman was working with. The redesign ofTHE GUARDIAN had
to be able to cope logically with a large amount of advertising
while still maintaining a particular character, so as not to
alienate its readers.   This was done by creating the solid grid
structure, and by dividing the main body of the paper into
sections.   In this way feature articles, news articles and
advertising could all be placed in positions signifying their
informational content and their priority within the page, without
impinging on each other, to the detriment of the separate pieces
of information and the overall 'readability' of the paper.

This sectioning approach has been criticised as being too
magazine like, and therefore too obviously design orientated.

> Clive Irving epitomises a journalist's view that the design
> has been imposed: 'Newspaper design is basically organic, it
> grows out of a newspaper's value system.   There is a
> fundamental argument between editorial and design thinking,
> and you need to build up a comming language between the
> disciplines. **(LUNA, April 1990, Pg.54).**

While Irving is undoubtably correct in stating that there must be an interaction between editorial and design decisions, he iss in fact overlooking this very fact, when it comes to the editorial brief that Hillman was working with, as Luna explains:

> If the design overall has become magazine-like and feature orientated, this must reflect the editorial brief.   Pete Preston was Features Editor in the 1970's, and his view of THE GUARDIAN as a "people paper", with emphasis on its writers, undoubtedly influenced Hillman's innovation of cut-out heads above the title-piece to signal inside stories. **(LUNA, April 1990, Pg.56).**

As regards creating a dialogue between the editorial and design disciplines, Hillman would seem to basically agree with Irving's statement, as from the article <u>Shooting in The Dark</u> by Hugh Tisdale for BASELINE magazine,

> Hillman admires the willingness to experiment shown by the paper, he was an outsider who was trusted.   He feels that ninety percent of the British Press think that employing designers is undesirable, and that this mistrust is nowhere near as marked in the United States and Europe.   He believes that the designer should be independent of the journalist, to foster objectivity and honesty, and that a sound relationship involves questioning by the journalist and a commitment to the content of the newspaper by the designer. **(TISDALE, 1990, Pg.13).**

In the book <u>The Graphics of Communication</u> Russell N. Baird,
Arthur T. Turnbull and Duncan McDonald define three categories of
newspapers which have prevailed in contemporary times.

1. Those that have gone to a totally 'magazine-like'
   approach.

2. Those that have accepted the principles that relate
   directly to a functional approach to news presentation,
   but have retained some traditional approaches to news
   display and headlines.

3. Those that have made a minimum of changes because they
   want to retain a traditional personality.

(BAIRD,1987, Pg.56).

While these are very broad categories, it is possible to relate
the newspapers under discussion to them.

70

Before we do so, however, it is helpful to give a definition of
the statement, 'a functional approach to news presentation'
according to the authors of The Graphics of Communication, the
functions of design are as follows:

- Creating a clear, orderly flow of graphic elements.
- Attracting the intended audience with proper focus and
  stimulating presentation.
- Reflecting production needs through a design system
  which considers available processes and personnel; and
- Supporting content rather than overwhelming it!

(BAIRD, 1973 Pg.57).

THE GUARDIAN fits mainly into the second category, although as we
have seen, there are those who argue that it has become more
'magazine-like' than is desirable for a newspaper **(cf. IRVING).**

Broadly speaking, Hillman's design fulfils all the criteria
stated above. For instance the formal, pre-planned look already
mentioned would seem to create a 'clear, orderly flow of graphic
elements.'
Most importantly, in the context of this thesis, is the manner in
which THE GUARDIAN fulfils the third function of design, i.e. how
it reflects production needs through a design system which
considers available processes and personnel. If we go back for
a moment to Luna's statement concerning the reasons for THE
GUARDIAN's re-design, when he states that one of the reasons was
that technology could now overcome the crowded, muddled sequence
of pages which had resulted from the large quantity of classified
advertising within the paper.

Here we see, that while much of THE GUARDIAN's re-design involved
the use of the new technology, that technology was used in a
purposeful manner, reflecting an overall design strategy.   It
was seen as a means to an end, rather than seeing it as an end in
itself.

THE IRISH PRESS, on the other hand, does not fit into any of
these categories because the system of production it is trying to
attain (use of the new technology) has become, in the perception
of the organisation, an end in itself.   As we have already seen,
its new format and the shift towards new technology was adapted
to increase circulation by gaining a younger readership.   The
system of production is equated with the 'look' of the paper, to
the detriment of an overall design strategy.   The use of new
technology has become an end in itself, while the functional
design criteria have been abandoned.

'60p a gallon on petrol' if Gulf war begins

By BRIAN DOWLING

PETROL prices are likely to soar by more than 60 pence a gallon if war erupts in the Gulf sending the price to over £1.40 per gallon at the pumps, industry sources warned last night.

World holds its breath as peace hopes fade

By CHRISTOPHER LOCKWOOD in Baghdad
and STEPHEN ROBINSON in Washington

THE world today holds its breath as the countdown to a war in the Gulf enters its final 48 hours with little hope left of a last-minute peace formula.

UN Secretary General Javier Perez de Cuellar ended his visit to Baghdad with the words "God knows if there will be peace or war."

And US President George Bush warned Iraqi President Saddam Hussein he would be making "a tremendous mistake" if he does not withdraw from Kuwait by tomorrow's deadline.

U.N. chief tells the world...

WAR: 'ONLY GOD KNOWS'

Perez de Cuellar speaking in Baghdad last night.

The despair of Lithuania

75

UNITED Nations Secretary General Javier Perez de Cuellar left Iraq last night after 11th-hour crisis talks with President Saddam Hussein yesterday, saying that only God knew whether war in the Gulf could be averted.

Asked at a crowded airport news conference whether there would be war or peace, Perez de Cuellar said, "That is a question almost impossible to answer. It is something only God knows."

The U.N chief declined to discuss the substance of his talks, saying he would report to the United Nations Security Council today.

Iraqi President Saddam Hussein said occupied Kuwait would remain part of Iraq, almost certainly killing the last hope of avoiding war.

Baghdad Radio broadcast his uncompromising message as UN Secretary-General Javier Perez de Cuellar held 11th hour talks in Baghdad.

Later the UN chief left for Paris, where a Luxembourg spokesman said he would meet EC

representatives either late last night or early today.

An emergency meeting of EC foreign ministers has been called for 11 a.m. this morning in Brussels.

In barely 60 hours a UN deadline expires and will trigger war if Iraqi troops are still in Kuwait.

Iraq pursued its litany of death threats against the US-led multinational force, forecasting tens of thousands of deaths and promising surprises in its armoury.

As the sounds of war grew louder, tens of thousands of activists marched in Germany, Britain, Spain and Belgium.

The United States and Britain told the Iraqi ambassadors to cut their staff in Washington and London to four each in the next 48 hours, effectively expelling 40

diplomats and embassy staff.

In Baghdad, a few lone embassies, Soviet, French, Cuban, and Arab, were still operating, mostly with skeleton staffs. Forty-six diplomats left early at the weekend and yesterday a convoy of 12 cars headed off from the Turkish compound.

"Once war starts, there will be nowhere to run (in Baghdad) and nowhere to hide," one diplomat said before leaving.

At Baghdad airport, people scrambled for a flight out.

"People were jumping queues, pushing and shoving for fear the flight would be overbooked. There's fear of a total breakdown in order shortly," said a Westerner reaching Amman. Rumours in the capital suggest Iraq might shut its airspace to prepare for attack

To Page 8
LITHUANIAN President Vytautas Landsbergis, looking in total despair, addressed the nation early yesterday morning from the Parliament after the Soviet troops stormed the T.V. tower, killing 11 and wounding hundreds.

Appealing for Western countries to condemn the Soviet military crackdown on the rebel republic the President also calls for a United Nations Security Council meeting. Meanwhile, the head of the Lithuanian parliament's foreign

affairs committee said Lithuanians were prepared to defend their parliament building with weapons from a take over by Soviet troops.

"The parliament is the last temple of freedom," Lithuanians would defend it "with all possible ways, including weapons."

Between 1,500 and 2,000 people were inside the darkened parliament and 20,000 supporters of the legislature were outside in defiance of a curfew imposed by the Soviet army.

● Petrol . . . emergency
stocks should last 120 days.

'60p a gallon on petrol' if Gulf war begins

PETROL prices are likely to soar by more than 60 pence a gallon if war erupts in the Gulf sending the price to over £3.40 per gallon at the pumps, industry sources warned last night.

Oil industry sources said it was likely the cost on the international markets would rise to between $40-55 per barrel from the existing $28 dollars per barrel.

"Increase in the international

By BRIAN DOWLING

prices are inevitable, but most analysts agree the increases would be within the range of $40-55 dollars per barrel. If they went to the upper end increases this would bring the Irish petrol prices up by just over 60p per gallon," said one expert.

The Irish price increases would be composed mainly of 50 pence by the oil companies plus about 12 pence in VAT. If prices were to rise on the international market over the next

two weeks, they would be passed on to motorists in February.

Last night, Minister for Energy Bobby Molloy, who already signed an emergency powers order allowing him control petrol prices and distribution, rejected reports that there was only 22 days petrol supply in storage. He stressed there was no need for panic.

Mr. Molloy said contingency plans had been activated since the invasion of Kuwait and there was now about 120 days stock of oil in

crude and product form. Allowing for changes on a day-to-day basis stocks broke down into 90 days of petrol, 90 days gas, diesel oil reserves and 329 days of heavy fuel oil reserves, mainly used by the ESB.

In addition to this, Mr. Molloy pointed out that the International Energy Agency, of which Ireland is a member, has agreed that in the event of war it will stock-draw 2.5 million barrels of oil per day to deal with any threat to the distribution of supplies. This would be reviewed after ten days.

Mr. Molloy also said while plans had been drawn up for the issue of petrol ration coupons they did not expect to have to resort to this for quite some time if the Gulf war began.

But if war did start, measures would be taken to eliminate any wastage and in addition the gardai would vigorously enforce the 55 mph speed limit.

At the same time, a Gulf war could open new hopes for an oilfield which lies about 120 miles into the Atlantic off the Connemara coastline.

A slimline Guinness trips the light fantastic

● Galvina Samsova, artistic director of the Scottish Ballet conducting a masterclass at the Digges Lane Studios yesterday.
Picture: Ronan Quinlan

No dancing in the dark here

By RICHARD MOORE

THE MISINFORMED, who may have felt that a Guinness Masterclass had something to do with the national hobby of sinking the black would have suffered culture shock in Dublin's Digges Lane Theatre yesterday.

The nation's top beer belly would have positively shrunk had it caught sight of 23 of the country's leading ballet dancers going through their paces before the formidable Russian ballerina, Galina Samsova.

Ms. Samsova, who formally hung up her dancing shoes on Saturday night after an internationally-acclaimed career over four decades, confessed that several of the youngsters, aged from 12 to 20, who tip-toed into her masterclass, would pirouette confidently onto the professional stage.

Among those putting their best feet forward were three males — their presence in such numbers even startling Ms. Samsova, who may have been forewarned that it has only been since the '70s that the man on the street here has conceded that the 'I' in ballet is silent.

But old perceptions die hard and ballet, despite the fact that its demands on the body would leave the average footballer wilting on the wings, is to masculinity what brown sauce is to haute cuisine.

Brenda Moore from Belfast, who was present to witness her daughter, Brenda (15) participate in the 90-minute class, confessed "it would be over her husband's dead body" that any of her sons would pack a leotard into a sports bag.

FitzGerald slated over abortion referendum

A RECENT in-depth study of the Pro-Life Amendment campaign here reveals "deplorable" conduct by the Taoiseach of the day, Dr. FitzGerald, a leading churchman has claimed.

By SEAMUS CLAFFEY

And the priest expressed surprise at the extent of Mrs Mary Robinson's involvement on the anti-amendment side.

The comments are made by the director of the Catholic Communications Institute of Ireland, Fr Martin Tierney, in a review column in the current issue of the Irish Catholic newspaper.

Under review is "The Second Partioning of Ireland," a book by Tom Hesketh.

Priest criticises Robinson's role

that gives a blow by blow account of the 1983 Abortion Referendum campaign.

"The author charts the infighting, manoeuvering, chicanery and venom of the campaign to insert a pro-life clause in the Irish Constitution," according Fr Tierney.

Dr FitzGerald, who opposed the amendment, is accused by the priest-reviewer of having "taken more U turns" on the issue "than a teenage joyrider".

"Garret FitzGerald weaved and ducked and chopped and changed in quite a deplorable way."

When contacted by the IRISH PRESS, Dr FitzGerald declined to comment on the substance of Dr. Hesketh's book or Fr Tierney's remarks.

It is clear from the study, the reviewer adds, that "Charles Haughey never wavered in his commitment to the amendment, but political expediency was certainly part of his motivation".

"I was surprised at the significant role played by Mary Robinson, our new President, throughout the campaign," the review continues.

"The climax of her commitment to the anti-amendment cause was the delivering of a two-and-a half hours speach against the amendment in the Senate."

The extent to which politicians in the South are prepared to accommodate the Protestant viewpoint was an eye-opener," Fr Tierney remarks.

But Church of Ireland Dean Victor Griffin has defended his decision to vehemently oppose the amendment He told the IRISH PRESS he had no hesitation, then or now, opposing the insertion of morally controversial and divisive issues in the Constitution.

In opposing it, Dean Griffin stressed that, far from promoting abortion, as was alleged at the time, he was attempting to uphold the principle that the Constitution should reflect a consensus of all the people.

On the Catholic side Fr Tierney suggests some priests used their pulpits often in an emotive and manipulative way.

Shops may pay informers

SUPERSTORES and shops throughout the North are to introduce strict new staff vetting procedures in the wake of a firebomb blitz that cost an estimated £100 million pounds worth of damage.

Senior RUC detectives believe IRA insiders were responsible for planting some of the bombs which caused widespread blazes and 400 jobs — in High Street shops in Belfast and Lisburn eight days ago.

One step being considered by firms and supported by the Northern Ireland Office is the introduction of a scheme whereby employees who inform on their workmates would be rewarded.

The shop-a-mate scheme would include information on everything from undeclared criminal convictions to membership of a suspect party.

A leading businessman admitted yesterday. "Clearly vetting procedures for employees are not all they might be. There is now a determination to deal with the problem of insiders who are sympathetic to one cause or the other.

Some people may suffer because of this but strict and urgent precautions are vital.

The worst damage was caused to Texas Homecare, Allied Maples and MFI at Sprucefield Centre in Lisburn where Sainsburys, Harry Corrs and Poundstretcher were also firebombed.

Since the attacks staff now check premises at least three times daily.

There are some outlets who simply refuse to employ people who live in troubled districts," the businessman admitted. "I think that is wrong but if you are in business you have to ask yourself the question 'Can I trust my employees'.

Which of them is vulnerable to approaches from paramilitary organisations? If the enemy is within then action will have to be taken."

New 'Yeats' discovered

A JACK YEATS painting which has lain for years in a cupboard in the local museum of Merthyr Tydfil in Wales, was recently discovered and is now valued at between £60,000 — £80,000 Stg. The curator of the museum who found the painting took it along to the BBC's Antique Roadshow for valuation. An art expert described it as a very valuable discovery.

● GAY BYRNE dons cowboy gear for his role in Oklahoma

Gaybo and Co sing Oklahoma

THE metaphorical curtain is due to be raised in RTE today when Gaybo joined by a cast of 70, will put on the most unusual version of the Rodgers and Hammerstein classic "Oklahoma" ever seen in the history of Irish musicals.

The production, which is the brainchild of the Gay Byrne Show's producer Ann Walsh will be broadcast live from the station at 9.15 a.m. minutes after the cast go through their final rehearsal.

Members of musical societies from around the country jumped at the idea to perform the show live on the airwaves. Auditions were held in almost every corner of the land to trace the budding stars.

Gay Byrne takes on the role of Andrew Carnes — Ado Annie's father and intends dressing up for the part. Jackie Winklass of Dundalk and Sandra Kelly of Dublin will play Curly and Laurie the two main characters in the musical.

The entire cast have been rehearsing in RTE over the weekend. To ensure that the atmosphere is right they will all be decked out in cowboy gear during the performance.

Chapter 5

Conclusion.

As was stated in the introduction to this thesis, the advent of
the new graphic technology is related to the overall phenomenon
of information processing technology, the newest and most
pervasive technology of our time.

It is helpful to relate the new graphic technology to the overall
phenomenon of information technology, because it gives us access
to some broad discussions on the various aspects of information
technology in relation to systems of production.

There seems to be two main points of view within the newspaper
industry as regards the possible effects, advantages and
disadvantages of the new technology.

85

The main argument for those who are 'for' new technology seems to
be the 'speed and flexibility' of the new technology, its
immediacy.

The general argument against the switch to new technology (which
we have seen stated earlier) is that with the old system of
design and production, there is a sense of 'discipline' which is
gained through a sense of 'intimacy' with the processes of that
system.

These two points of view can be related to two loosely defined
camps within the main body of opinion concerning information
technology.   Forester, in his article Making Sense of I.T.
gives a broad definition of these two differing opinions:

> Sociologists argue about the merits of 'technological
> determinism' versus 'social shaping,' or human choice within
> a socio-cultural context.   In other words, is our future
> being determined by technology, or are we to some extent free
> to choose and shape the future. (FORESTER, 1989, Page.2)

Forester also states that within the area of discussion of I.T.
there is a distinction between 'optimists' and 'pessimists', and
that:

> Not surprisingly, technological determinists tend also to be
> pessimists, while 'human choice' supporters tend to be
> optimists, but this is not always the case. (FORESTER, 1989
> Pg.2).

It would seem that within the field of newspaper design, those
who feel that the capabilities and advantages of the new
technology, including its 'speed and flexibility,' are too
important not to use.   That it is absurd to have the new
technology and not use it, are related more to the 'optimist' or
'human choice' school of thought.

Technological determinism seems to be the underlying fear of
those who say that the switch to the new technology will involve
the loss of many of the human attributes of the design process,
i.e. reflectiveness and discipline, the intimacy which comes from
being closely involved with the design process.

While the new technology does help create designs with great
flexibility, it is important to note it does not totally create
the finished product.   It is a means of production, it is
designed to help produce. As a means of production it obviously
has an effect on the final form of the product, just as any other
thing will be affected by the means of its production.   It is
important for both the 'optimists' and the 'pessimists' to look
at the new systems of graphic technology objectively, and see
them for what they are, systems, designed to be used for a
specific purpose on a human level.

As Forester quotes Larry Hirschorn in Computers and the Human
Context

>   The new technologies do not constrain social life and reduce
>   everything to a formula.   On the contrary, the demand that
>   we develop a culture of learning, an appreciation of emergent
>   phonemona, an understanding of tacit knowledge, a feeling for
>   interpersonal processes, and an appreciation of our
>   organisational design choices. **(FORESTER, 1989, Pg.5).**

So instead of creating a sterile, impersonal work environment
(which is what the technological determinists seem to fear), here
we have an argument to say that the switch to new technology does
not destroy the existing system of human involvement within the
design and production structure, but rather creates another,
sligtly more communications oriented, system of design and
production.

This seems to echo what was said earlier, in that the new
technology, instead of destroying completely the old
inter-personal structure, creates a new, more collective (because
it is less specialised) structure.

So while we have seen that the new technology can create a
different system of design and production, is it possible to say
whether it is an innovating force in itself.

As we have seen from our brief look at the various technological
changes in the history of printed communications, these changes
affected the form of the product. But in most cases, (and
especially with newspapers) the design brief remained the same.
The function of the newspaper remained the same.

Those changes in newspaper design that can be called innovating,
the change from newsbook to newsheet for example, where achieved
not solely by that technological shift, but rather by application
of the design brief, using the new method of production.

The same applies today. The new technology is, in itself, not the innovating force.   Innovation comes when the designer or designers apply their design brief from the new perspective given them by this new technology.
